

# Quality Acrylic

*As individual as your patient*

Race Dental Laboratory's acrylic department has been servicing Australian dentists since 1937. Our expertise covers all aspects of dental acrylic work and we pride ourselves on providing acrylic which fits well and looks great.

## Full On Full Dentures

Our acrylic department offers two forms of pressed acrylic denture - heat-cured and cold-cured - giving you more control over strength and finish times. We understand that restored teeth must be as individual as the patient and we use state-of-the-art techniques and materials to produce an end result which is as close to your patient's own natural dentition as possible.

## Partial Dentures

As dental hygiene awareness is improving, patients are keeping more teeth into their later years and may require a partial denture when a full mouth restoration isn't necessary. Teeth are set into acrylic and can be retained by clasps or implants. Partials can also be set onto chrome frameworks, resulting in a lighter weight and more comfortable feel. This also adds strength and durability to the restoration.

## Implant-Supported Solutions

Race dental laboratory can manufacture a number of denture solutions utilising implant technology. We use all implant systems available in Australia and have access to the largest commercial stock of implant componentry in the country.

## Valplast

Valplast is a flexible resin which offers many advantages over traditional partial materials. Please see our Valplast information sheet for more details.
