

Premium Restoration

## Ivoclar e.Max Pressed

### Aesthetic glass-ceramic restorations

IPS e.max is a modern and innovative system using trusted, reliable technology from Ivoclar-Vivadent. e.Max is suitable for a wide spectrum of all-ceramic indications. The aesthetics of this system are impeccable and are also characterised by high mechanical strength.

#### How It Works

This system utilises lithium disilicate, which demonstrates superb aesthetic properties. It is most often used to restore single teeth in the anterior and posterior region and can be employed as a crown, inlay, onlay or veneer.

A specially-designed veneering ceramic allows for customisation and individual internal effects to suit your patient's requirements. e.Max crowns and bridges can be placed using not only adhesive, but also self-adhesive and conventional techniques.

#### Benefits

- Premium, transparent aesthetics with custom shading and internal effects
- Suitable for anterior and posterior applications
- Suitable for bonded placement under certain conditions
- ShadeVision shadetaking service available (charges may apply)
